MAIN:

Peregrin Hyde

My whakapapa links me through Ngāti Maniapoto to Te Rohe Pōtae and Kāwhia, and through my tūpuna pākehā to Scotland and England. I am an avid creator exploring visual arts, microscope photography and video, [music](#), [sound design](#), 3D modeling, education and science communication, game design and jewelry-craft. In addition to 8 years of experience in environmental education program development and guiding, I also have a wealth of experience presenting and performing my various practices in a wide variety of settings and spaces, from art galleries, to music festivals, to art markets, from the vast open ocean and the far reaches of the subantarctic, to contemporary dance performances and community fairs.

Creative generalist spanning visual programming, games, sound design, music, microphotography, 3D, video art, infographics, project management and jewelry-craft.

Portfolio:

Major Projects and Work Experience:

2024: [Into Ocean & Ice](#) - Exhibiting Artist
(Microphotography prints) Soundscape Composer, Video Producer (Video work *Cryosphere*).

2024: [Wānaka Arts Society Artist in Residence](#) (Labour Weekend Exhibition).

2024: [Voice of Tangaroa - Official Podcast Soundtrack](#)
Composer and Co-Producer. Original soundtrack created for the science-talk podcast series [Voice of Tangaroa](#), produced in collaboration with RNZ and New Zealand Geographic.

2023 - [Inspiring Explorers Expedition to South Georgia with Antarctic Heritage Trust](#) - Selected as a member of the visual arts team to create images showcasing the beautiful minutiae of this utterly spectacular and remote

island. Works to be exhibited at the New Zealand Maritime Museum in November 2024. Seconded onto the Education Team to develop a card game, and worked with RNZ's Our Changing World to record, narrate and produce [a podcast episode about the expedition's meteorology project](#).

2022-Present: Events facilitator at a bespoke central-Wellington venue - skilled in backend audio & sound desk operation, event administration, spatial design, artist liaison and more.

2019 - Present: Synth player and producer for Wellington prog-electronica project [Grains](#).

2018-2023: Education Ranger at [Te Māra a Tāne Zealandia Ecosanctuary](#). As a core member of the Education team, I developed and delivered a wide range of education programs to thousands of students of all ages at the sanctuary.

2018: Spent two months at sea with the [International Ocean Discovery Program](#) as New Zealand's Education and Outreach Officer aboard the JOIDES Resolution as it retrieved rock core samples from the active undersea Brothers Volcano. My role involved the creation of educational resources, [video](#), [360 VR content](#), [blogs](#), music, visual art and social media posts to promote the groundbreaking science of [Expedition 376](#).

2016: Exhibition Supervisor for Wētā Workshop's [Bug Lab](#) at Museum of New Zealand Te Papa Tongarewa. This role involved coordinating a front-of-house team, overseeing smooth operation of procedures and experiences, and producing a from-the-floor report of the exhibition at its conclusion.

Microphotography

Utilising microscope imaging techniques and experimentation with a wide range of media, Peregrin Hyde creates visually striking artworks and live experiences which elicit awe and curiosity, fusing art with science. These explorations of microscopic phenomena in print and video establish intimate contact with minutiae reality, revealing the staggering detail hidden in the hyper-textured universe.

In video and performance, live "evolving paintings" reveal the frenetic nature of simple chemistry and mundane occurrences, confronting viewers with uncanny paradoxes of scale, unseen domains of natural processes and the fingerprint of fundamental physical laws.

Past Events & Projects:

31/12/2024: YolkClub - VJ collab with Grace Wiegand and Tor Halle-McIntyre at [Twisted Frequency Festival](#). Live augmented Microscope projections cast across 7 flatscreen TVs during Dojo stage's Experimental Music Night.

24/11/2024: [Into Ocean & Ice](#) - Exhibiting Artist (Microphotography prints) Soundscape Composer, Video Producer (Video work *Cryosphere*).

17/10/2024 - 30/10/2024: [Wānaka Arts Society Artist in Residence](#) (Labour Weekend Exhibition).

28/09/2023 - 17/09/2023 - [Inspiring Explorers Expedition to South Georgia with Antarctic Heritage Trust](#) - Selected as a member of the visual arts team to create images showcasing the beautiful minutiae of this utterly spectacular and remote island. Works to be exhibited in November 2024.

13/04/2023: [Magnifying the Microverse](#) at [Capital E](#): A fun educational workshop where 16 children aged 7-12 got to become Microscope artists for the day.

07/04/2023: [Morphic Musings](#) - Collaborative Audio-Visual Projections for contemporary dancer Georgia Beechy

07/01/2023: [Tactile Society](#) - Microscope Projections for bands and DJs at a wonderful mini-arts festival in Whakatū, Nelson.

31/12/2022: Dojo Ambient Night - Microscope Projections for a range of talented live-ambient musicians at [Twisted Frequency Festival](#).

08/10/2022: Microscope Projections @ Pajamas, private party in Neukoln, Berlin.

29/07/2022: Microscope Projections & interactive treasure hunt at Peloton Festival a La Vounaise, Switzerland.

08/07/2022: If Walls Could Talk - Microscope Projections as part of a unique Variety Schow @ Haus der Statistik, Berlin.

18/01/2022: [Exploring Microworlds](#) @ ZEALANDIA EcoSanctuary - Educational Holiday Programme workshop.

1/1/2022: [Twisted Frequency Festival](#) - Live Microscope VJ set @ The Dojo

18/12/2021: ??? Mary Hush ??? - Live Liquid Projections @ Private 70s-themed party

30/10/2021: Sensonaut-y Secret Party - Live Liquid Projections @ [Sensonauts](#) Party

16/10/2021: [Art Market @ MEANWHILE Gallery](#)

11/08/2021: [PereScope @ Commonsplace](#) - 5hrs of live liquid projections & generative synthscares

29/05/2021: Audio Visual Collab w/@cyberboy666 @ Bakery

21/05/2021: Integration 2.0: Cabin Fever (Live Microscope Projections)

16/05/2021: LIVE Microscopic Explorations @ ArtJam! (Newtown Community and Cultural Centre)

06/05/2021: Audio Visual Collab w/@destroywithscience @ Art Hack

27/01/2021: KiwiBurn 2021: Live Microscope Projections @ CreatureLab

Music & Audio

Grains

Synth Player, Song-Writer & Producer. Beginning in 2019 as an ambient synth project utilising Wellington-made synthesisers, we have undertaken a wide variety of composition work and specialty performances.

In 2020 we expanded to a 5-piece band, gained a dedicated local following, and went on to perform at summer festivals including Eyegum's Welcome to Nowhere and Twisted Frequency. We released our debut self-titled album in April 2024.

Grains (2024):

Voice of Tangaroa - Official Podcast Soundtrack (2024)

Composer & Co-Producer.

We were approached by RNZ to produce an original soundtrack for their science-talk podcast series *Voice of Tangaroa*, produced in collaboration with New Zealand Geographic. For this project, we utilised a wealth of underwater hydrophone recordings, and worked with extensive resampling and granular synthesis techniques to create an immersive and unintrusive audio-bed for this informative and thought-provoking podcast series.

LaserDreams (2023)

Sound Design & Composition.

Te Ramaroa Nelson Lights Festival, 2023, saw the debut of this collaborative audio-visual project between myself and [LightCraft Lasers](#).

Showcase Video:

NO ORDINARY
SUN

Hoot - Unreal Engine 5.5

Space invaders for owls. First Unreal Engine project. An experiment with pre-rendered 2D sprites using a pixel-art shader and a dark, moonlit bruise-punk aesthetic. Levels generated randomly by spawning environment sprites upon one another.

CyberDoof - DoofDuck & Friends - DJs in Space

Blender Geometry Nodes - MagicaVoxel pipeline.

Created a bunch of 3D flora and fungal voxel assets for use in constructing levels for [CyberDoof's 3rd public event](#).

Coding

Grains: Succession II - Falling Sand Music Visualiser (Java p5)

Click in the top left corner to run the song and watch the simulation evolve!

Click anywhere on the screen to spawn your own sand.

University Java p5 Creative Coding Project.

Falling sand simulations, like similar cellular automata, function by creating a two dimensional array of co-ordinate locations representing the screen space, and applying a for loop to scan through the array (from bottom to top) and determine the behaviour of each cell based on a set of simple rules. A cell can be empty (value = 0), or filled (value < 0), and different values can be tied to different behaviours (Custom sands).

This simulation also has sand behaviours mapped to music-driven values. The music data was extracted using a machine learning algorithm, and these values drive things such as sand spawn rate, sand spawn type, plant growth and more.

The music is [Grains](#): Succession II, a track that explores the cohesion and conflict between humanity and the natural world. As the track progresses, different paradigms of the simulation emerge. The end is fire.

Other Stuff:

Coexistence - Live at Te Kōkī (2020)

*Composition for Te Kōkī New Zealand School of Music's
Electronic Showcase.*

A Multisensory Dining Event (2019)

Composer & Performer.

Teaming up with Award winning chefs Alex Davies ([Gatherings](#)) and Giuolo Sturla ([Mapu](#)), we composed and performed 5 ambient semi-generative soundscapes to accompany a 5-course degustation evening at Gatherings, Ōtautahi. A special range of natural limestone wines were provided by [The Hermit Ram](#).

The compositions each took into consideration the taste and flavour profile of each course, the natural origins of the ingredients and the wine accompaniment.

"The fading green of your magic

emanations shall not make pure again

these polluted skies . . . for this

is no ordinary sun." - Hone Tuwhare, 1964

NO ORDINARY SUN

Game Design Prototype by Peregrin Hyde

Unreal Engine 5.6

[Click here to download](#) and play the game for free! (1.3GB)

No Ordinary Sun's title is a homage to a work of the same name, written by the late poet Hone Tuwhare (Ngāpuhi. 1922-2008). Tuwhare spent time deployed in Japan in the aftermath of World War II and witnessed first-hand the ruin of nuclear devastation. His renowned poem, *No Ordinary Sun*, is a rich and evocative lament regarding nuclear annihilation, resistance and futility. These are among the themes explored in this game prototype. Nei rā te mihi ki a koe e Hone, i ōu kupu whakamanawa.

No Ordinary Sun is a movement-based puzzle game prototype set in a bleak, dystopian world in crisis. The player - somewhere between a penguin, an albatross and a human, begins in a dark and noisy underground chamber, holding a strange glowing red orb. Thousands of their kind look down upon them before they are sent on their way to an overworld devoid of characters. The environment is a rugged, barren volcanic slope covered in sand and clad in brutalist concrete structures. Heading downhill, the player enters an empty city blaring with sirens - something ominous is afoot. A gate blocks their progress. The player must move about the level at pace

using snowboard-esque mechanics and a unique teleportation method to open the gate and proceed to the great wall where they will undertake a most woeful deed. This project was developed and completed for VUWs GAME202 course between July and October 2025, and has been an exercise in rapid-prototyping, asset pipelines, and level design using Unreal Engine 5.6.

Character

The profiles of the character were created using two-dimensional curves in Blender. This proved to be a fruitful workflow, as these profiles could later be rapidly iterated in new poses, duplicated and modified to create many of the decal frescos found throughout the game world

The 3D character was modeled in Blender. Adobe Substance Painter was used to finalise the texturing. The tail was created from a mirrored radial array of feather cards. The texture applied to these cards is also a render of a collection of mirrored and arrayed 2D Blender objects. This was done by using a screen shot of the tail UVs as a guide, and fitting the 2D blender objects to them in orthographic view. When applied as a texture to the feather cards, they have created a compelling recursive pattern.

Level & Movement

Creating a large world posed a challenge - the player would need to get around it painlessly. To address this, I decided that this penguin-esque game character would belly slide. This was achieved with a roll-ball physics object that controls the character position when sliding is active, and though an almost unserious exploration at first, this mechanic was too fun to drop. With a basic roll-ball guided movement system in place. I began designing the level - it would function as a ski slope, with fast downhill motion and limited uphill movement. Pinching the valleys would guide players into the abandoned city, even if they initially weren't sure where to go. This presented a new problem however - players would become stuck once they'd followed the slopes all the way down. To remedy this, I implemented a teleport mechanic, by which the player could use the "device" to teleport to the bunker entrance at the top once more. This would open up the level for multiple "runs" allowing the player to explore other routes and areas, and I could begin scattering collectibles (in the form of statue keys) to progress the game. With movement now driving aspects of the gameplay. I created some assets with slope and ramp shapes to encourage players to approach the world like a snowboarding game. Much later in development, additional

actions were implemented, including a flip, a wall run, a concrete hop, boosting from disintegrating plants, and the ability to place more teleport "tethers".

Assets

Flora

The flora assets were created in Blender using a geometry node system. This system takes a user curve as an input, resamples and perturbs it, creates a tapered mesh cylinder and spawns branches from random faces. These in turn spawn "crown", "flower" and "leaf" objects at their end points. This system allows for quick iterative designs of flora assets, with user-input sliders for parameters such as trunk thickness, part size, perturbation and more.

In game, the vegetation are instanced as blueprints which catch fire and disintegrate when the player approaches it. In addition to being hand-placed, these actors are instanced in the world using Unreal's Procedural (PCG) framework.

Architecture

Building assets were also created in Blender. A simple base mesh would be made taking notes from several brutalist architectural works here in Aotearoa (notably the Michael Fowler Centre and the National Library of New Zealand). I applied a Geometry Nodes modifier to some of

these which created subinstances of the base mesh recursively upon itself. Some of these resulted in very intriguing interior and exterior spaces, and Unreal Engine's modelling tool and breadcrumbing was used to pave sensible accessways where needed. In engine, kitbashing was used extensively to rapidly create the sense of (often the illusion of) being in a dense, chunky brutalist city bound at one end by a great wall.

Updated: Dec 3, 2024

Into Ocean & Ice: Artists explore a changing Antarctica

Hui Te Ananui a Tangaroa | New Zealand Maritime Museum

Nov 29 - Aug 31 2025

This project has been a long time in the works. I am so excited to finally share it! Back in October of 2023, I was super fortunate to travel to the wild and remote island of South Georgia as a member of the Antarctic Heritage Trust's 9th Inspiring Explorers expedition. I did a [write up about the expedition and my experiences in South Georgia over here on AHT's blog](#).

Look, a penguin!

So! A major component of these expeditions is outreach - as ambassadors for South Georgia, and the Antarctic region more broadly, we share our learnings and experiences with as wide an audience as possible. For me this year that's involved presentations, blogs and radio shows, but the *big* one has been a little bit under-wraps - until now!

I'm super thrilled to be exhibiting a diverse range of works alongside my dear friends and fellow explorers Charlie Thomas, Tegan Allpress, and Rose Lasham at this stunning new exhibition at the New Zealand Maritime Museum in Tāmaki Makarau. The exhibition showcases artwork we created during and after our 2023 journey.

Me and Charlie at work in The Lab, somewhere on the Scotia Sea.

The works I created for this exhibition include a special series of glass-printed micrographs, a floor projection and an immersive, musical-audio soundscape.

As I wrote in my blog for AHT, I was utterly awestruck by the scale of the thousands of icebergs we encountered on our journey around the island. The crew had not expected to see icebergs. In the weeks before our arrival, one of the world's largest icebergs (A76A) had run aground on the seabed to the south, fracturing into millions of pieces. Some of these pieces ended up under my microscope. This involved

plunging my hands into the freezing waters from a zodiac, and smashing the fragments up with an ice pick.

This ancient ice was full of stunning, sculpted forms, strange structures, trapped pieces of atmosphere and dazzling tricks of light. I like to think of each image as an intentionally tiny window into the staggering vastness that is Antarctica's ice. The original iceberg was an absolute behemoth - 170km long and 25km wide. If it were to run up against New Zealand, it could block the strait between the North and South Island. Of course, this iceberg was itself only a small fragment of a single ice shelf in

Antarctica. This is a continent nearly double the size of Australia covered (on average) by 2km of ice.

The process of melting fascinated me - how it starts off so very slow but invariably accelerates, how frozen bubbles of ancient atmosphere suddenly start to shift and deform before finally reuniting with the air. Capturing these fragments of ice in their final moments of melting filled me with a strange sense of melancholy. A transition between states: water solid to water liquid, form into formlessness. How long had it been frozen? Possibly thousands of years...! In this exhibition, that exploration has culminated in a video work called *Cryosphere*: a circular floor projection created from hours of time-lapse footage of melting Antarctic shelf ice and snow.

Cryosphere

In my work I've always been interested in distorting scale, seeking vast vistas and landscapes in tiny places. As above so below, patterns in nature often unexpectedly recur at every scale. The Antarctic limpet is an unassuming little mollusc, but to me they seemed intent on resembling South Georgia itself: little islands replete with huddled colonies of organisms clinging to their shells, patterns and structures that seem almost geological and protein film layers that were reminiscent of the icebergs visible from our portholes every day.

NC76-A - Fragments of the shell of an Antarctic Limpet

The night before I left for South Georgia, close to midnight, my dear friend Jed Prickett dropped in on me with a last minute addition to my inventory - a 3D-Printed parabolic microphone that he and Tor Halle-McIntyre had designed. This dish, rigged

up to a Zoom box enabled me to capture some spectacular directional recordings of environments and wildlife during the expedition.

Capturing recordings of a super-curious leopard seal

Listening to these recordings is like stepping back into the wilderness - so we were very keen to get these recordings into the exhibition. Throughout the exhibition, there are several speakers playing sounds from South Georgia alongside an ambient piece I composed that was inspired by my experiences of this beautiful, if harsh region.

The piece has no defined beginning or end, and is accentuated in the space by location specific recordings. Listen to it below on my soundcloud:

If you are in Auckland between December 2024 and August 31st 2025, give the exhibition a visit! It is included with entry to the New Zealand Maritime Museum (which is free if you are an Auckland local). The exhibition also features a stunning collection of paintings by artist Paola Folicaldi. These incredibly detailed works, many based on the photographs of Frank Hurley trace Shackelton's epic tale of survival between 1914 and 1916.

A massive thank you to the whole team over at the New Zealand Maritime Museum and Antarctic Heritage Trust! It's been an amazing journey, and I am excited for our artwork and stories to be experienced by visitors in the coming months.

Thanks for reading, mā te wā!

Artist Residency with Wānaka Arts Society

Nov 13, 2024

Kia ora koutou!

In October I was super fortunate to spend two weeks on the shores of beautiful lake Wānaka as the Artist in Residence for the [Wānaka Arts Society's 45th annual Labour Weekend Exhibition](#).

I got to stay in a cosy cottage with a view of snowcapped mountains, and spend my days focusing on creating and developing my practise for the exhibition at the residency's conclusion. The president of the society also provided me with a mountain bike (thanks Gaynor!), and my gracious hosts permitted me use of their land cruiser, so I also got to get out and explore the region, which is surely one of Aotearoa's most scenic - inspiration was everywhere!

The first week I settled in and powered through the challenge of imaging a wide variety of things for exhibiting. A trip to Diamond Lake Conservation Area turned up some striking lichens and a beautiful silk structure which came together in this micro still life:

Among the Lichens, Peregrin Hyde, 2024

I also took some water samples from the lake and found this neat little ostracod - a microscopic freshwater crustacean that protects its body with a bivalve-esque shell:

Ostracod, Peregrin Hyde, 2024

A enjoyed a wonderful bike ride out around the peninsula to the inlet of the mighty Mata-Au Clutha River. The turquoise color of the river is particularly striking, and inspired this series of prints made from imaging inks and dyes in open reaction:

Clutha Eddies Series, Peregrin Hyde, 2024

A fond childhood memory I have of Wānaka is visiting Puzzling World, a really cool hall of illusions set within a colourful and funky 70s building. Optical illusions have interested me since, and in my explorations of microscope photography I've often come across some really strange or unexpected tricks of light - like finding a reflection of myself a tiny microscopic bubbles. I spent the last few nights of the first week using goose-necked crocodile clips to carefully place different light sources, lenses, objects and mirrors in three-dimensional space around the microscope, which was trained on a butchered camera lens. That lens reflected tiny images of the objects

placed around it, and I'm really pleased with the results - composition is notoriously difficult in microscope imagery, as the tiniest tremor or sigh can send your tiny subjects flying off the stage. Working with the microscopic reflections, on the other hand, gave me much more room to maneuver and I could spend time on honing the composition.

Sculpting Microreflections.

Microreflections Series, Peregrin Hyde, 2024

That weekend I was treated by my wonderful hosts, the Johnstones, to jetboating adventure out on the West Coast - it was such a wild time, thanks Rob & Jean! The final work I produced during the residency was a mihi to this most beautiful region - Te Tai Poutini, a visage of it's dramatic landscape captured in a microscope image of its most precious substance, pounamu:

Te Tai Poutini, Peregrin Hyde, 2024

The following week was busy with some creative workshops - two of which were conducted at Mt Aspiring College, where Art students got to muck around with the microscope cameras and take pictures of their own - and the opening of the Labour

Weekend Art Exhibition at Lake Wānaka Centre. There were over 140 artists exhibiting over the weekend, with more than 400 pieces of art!

Beneath my works (printed and mounted by the wonderful [PrintArt](#)), I was thrilled to let the audience get hands on with one of the microscopes and a large screen so they could explore the magnificent beauty of the miniscule world around us.

My works on display at the Wānaka Arts Labour Weekend Exhibition, 2024.

I'm really thrilled to have been selected as the WAS Artist in Residence, especially given how left-of-field my work is. I deeply appreciate the support and positive feedback on my art and workshops during my time there. Personally I can't wait to visit Wānaka again sometime soon - especially as I was treated to a beautiful winter wonderland in the last few days - in late October no less...! A massive thank you to the Wānaka Arts Society, and my wonderful hosts Rob and Jean Johnstone for their hospitality and support :)

And so... On to the next thing... which is very soon! Watch this space :)

Thanks for reading

Ngā mihi nui,
P
